

# Pacific Harbor Seal *Phoca vitulina richardsii*

**Notes.** Haulouts may be occupied at any time of year for resting. Pupping generally occurs March-June (March-May at Pt. Reyes). Molting occurs May-July, (June-July at Pt. Reyes). Haulout data are from May-July, 2004; pupping can occur at any haulout site, and has been confirmed at sites shown; see data sources below. Harbor seals are year-round residents of the study area and at sea sightings occurred in all three seasons in all three sanctuaries; relatively low numbers of at-sea sightings precluded seasonal or overall density maps.
